

Shopify continue or deny inventory update

QUICK REFERENCE GUIDE — OPERATIONS · FULL SOP: SOP-OPS-006

1. Run Stock Replenishment with **Location = Warehouse**. Save over **Warehouse Inventory.csv**.
2. Re-run Stock Replenishment with **Location = Unfinished Warehouse**. Save over **Unfinished inventory.csv**.
3. Open **Unfinished inventory.csv** and confirm the **In Stock** column has no negative values.
4. In Shopify Admin, go to **Products** → **Export**, export **All products**, wait for the email.
5. Download the export. In Excel, delete columns **AV, AW, AX** (Canada price columns). Save over the file.
6. Open **Shopify - Continue Or Deny MSTR File Automation.xlsm**.
7. Run a full refresh on the workbook. When it finishes, run the refresh a **second time**.
8. Run the macro **Export Products Import Shopify**. The import file lands in the Daily Upload folder.
9. In Shopify, go to **Products** → **Import**, select the new file from the Daily Upload folder.
10. Set import options: **check the first option, uncheck the second**.
11. Click **Import products**. Leave the browser open until Shopify confirms completion.
12. Run the **same import a second time** to verify all updates applied. Confirm zero errors.

COMMON MISTAKE

Skipping the negative-value check in Step 3. Negative quantities silently disable products on Shopify — customers can't order them and the issue only surfaces when sales drop.

COMMON MISTAKE

Using the computer during the workbook refresh. Switching windows or opening files corrupts the import. Walk away while it runs.

TIP

Always refresh twice. The first refresh pulls fresh data; the second resolves dependent queries that the first one missed.

SHORTCUT

The verification re-import (Step 12) catches silent partial failures from the first import. Never skip it — re-running is faster than reconciling broken SKUs after the fact.

If unsure of any step, see full SOP-OPS-006.
