

Monthly flavour ordering.

STANDARD OPERATING PROCEDURE — OPERATIONS

Document ID	SOP-OPS-003
Document type	Standard Operating Procedure
Department	Operations
Owner	Operations Manager (purchasing)
Version	v1.0
Effective	May 2026
Status	Draft — in review

1. Purpose

This SOP defines how Operations places the monthly e-liquid flavouring concentrate order. It exists to keep production running by pairing recipe-based ML demand against on-hand inventory, unfinished-goods inventory and premix, then translating the gap into supplier-specific increments with a 10% safety buffer (or 90 days of coverage for slow suppliers). Stockouts on core SKUs — Loose Cannon, Skipper, Dark 30 — are the highest-impact failure mode and are not acceptable.

2. Scope

Applies to the Operations purchasing role responsible for monthly flavouring concentrate orders across all suppliers (Flavour Art, Capella, Flavora, TFA, Lorann, Innawera, Mullenberry, Bryson Flavorah, Dvine Laboratories, DIY E-Juice, and the Bulk US channel). Out of scope: bottle, PG, VG and nicotine ordering; label and packaging procurement; mid-month emergency top-ups (handled per-incident under § Exceptions).

3. Frequency and timing

The cycle runs once per calendar month, on the first business day after the previous month's physical inventory is closed in both the warehouse and unfinished-goods locations. Allow one to two business days for the data pull, decisions and printing before orders are emailed.

4. Inputs and prerequisites

- Master **Flavour Ordering** Excel workbook in the Operations OneDrive folder — this file owns the recipes, inventory snapshots, sales data and the auto-calculated ML need per flavour.
- Erply access with rights to **Reports › Sales** and **Inventory › Stock Replenishment** for both the Warehouse and Unfinished Goods Warehouse locations.
- Closed physical inventory for the month — the pull date for unfinished and warehouse must match the inventory date exactly, otherwise on-hand and unfinished totals double-count.
- Previous month's order list, used to clear column K in the Flavour Ordering ING tab before the new month's quantities are entered.
- Outstanding international customer orders for the current month, supplied by Sales (added on top of historical sales).

5. Pull International sales (last month)

International customer sales are entered manually because the order pattern is concentrated in a few SKUs with explicit forward orders. Prefer the safer side: extra flavouring on hand is reusable, a missed production run is not.

1. In Erply, open **Reports › Sales**.
2. Set **Customer group** to **International Customers**, **Period** to **Last month**.
3. Open **Item Sales › By Product (Excel)** and download the report.
4. In the master workbook, duplicate the most recent International tab, rename it for the current month, update the date header, and replace sales values by SKU using the downloaded report.
5. Add outstanding current-month customer orders on top of historical sales — baseline coverage for Loose Cannon, Skipper and Dark 30 plus any specific open orders (e.g. 50 × Blue Cannon 50 ML, 60 × Dark 30, 80 × Skipper).

The screenshot shows the Erply Reports › Sales screen. The 'Customer group' is set to 'International Customers' and the 'Period' is set to 'Last month'. The screen displays various filters and a list of sales reports.

6. Pull Concord stock replenishment (last 60 days)

Concord sales do not directly drive demand, but the master workbook depends on Concord stock and replenishment values populating on every tab — missing data here propagates blanks through the plan.

1. Log into the Concord Erply tenant.
2. Open **Inventory > Stock Replenishment** and pull the last 60 days.
3. Save the export to the OneDrive **Concord last 60** file location — keep the same filename so existing workbook links resolve.
4. If the workbook does not auto-refresh, in Excel go to **Data > Edit Links** and re-point the source to the saved file.

Use Stock Replenishment, not Products in Stock: the standard report omits zero and negative values, and a clear picture of inventory must include both.

Figure 2 — Erply Inventory menu — Stock Replenishment is under the Reports column on the right.

7. Pull unfinished-goods inventory at month-end

Unfinished-goods on hand must be subtracted from total need so the order is not inflated by stock that is already mixed but not yet labelled.

1. In Erply, open **Inventory > Stock Replenishment**.
2. Set **Location** to **Unfinished Goods Warehouse**.
3. Set **Date** to the last day of the previous month — the same date the physical inventory was taken.
4. Click **Stock Replenishment Report (CSV)** to download.
5. Open the CSV, select all (Cmd+A / Ctrl+A), copy, and paste into the **Unfinished** tab of the master workbook.

Date alignment is non-negotiable: if the unfinished pull is from a different day than the warehouse pull, the master plan double-counts or under-counts available stock.

Figure 3 — Erply Stock Replenishment form configured for the Unfinished Goods Warehouse on the last day of the month.

8. Pull Concord and warehouse sales (last 60 days)

Concord sales

1. In Concord Erply, open **Reports** > **Sales**.
2. Set **Customer group** to **Canada**, **Period** to **Last 60 days**.
3. Open **By Product** and copy the data into the **Concord Sales** tab of the master workbook.

Warehouse sales

1. In the DSS Erply tenant, open **Inventory** > **Stock Replenishment**.
2. Set **Location** to **Warehouse**, **Date** to the last day of the previous month, **Period** to last 60 days.
3. Copy the report data into the **Warehouse Sales** tab of the master workbook.

The Quantity Delivered Canada tab is no longer maintained — leave the tab in place but skip the refresh. Self-flavoured sales are now captured through pod sales tracking instead.

9. Calculate ML need per flavour

Once every white tab in the master workbook is refreshed, the plan tab auto-calculates ML need per flavour by SKU using recipe percentages and bottle volumes. Walk every row in order:

- Available for Canada minus units sold gives **units needed**.
- Subtract unfinished-goods units — if the result is negative, ML need for that SKU is zero.
- Where multiple SKUs share a flavouring (e.g. strawberry-watermelon, strawberry-pineapple variants), the plan aggregates ML across all SKUs that draw on it before the ordering tab.
- The plan does not subtract premix or already-mixed flavouring at this stage — that subtraction happens on the Flavour Ordering ING tab.

10. Generate the Flavour Ordering plan

1. Open the **Flavour Ordering ING** tab. *ING* stands for ingredient.
2. Clear all filters and save.
3. Verify that **Flavouring on hand**, **Liquid on hand**, **Premix in use** and **Usage planning** columns are populated from the upstream tabs.
4. In **column K**, erase last month's order quantities before entering the new month's. Sort or filter to **Quantity to order > 0** to focus the work, but do not re-sort the recipe rows — they must remain in source order.
5. Open the **Flavour Ordering Plan** tab. Right-click the pivot table and choose **Refresh**. Select all, then unselect the zero and blank rows.

The remaining list, broken down by supplier, is the order. Print runs and supplier emails work directly from this tab.

11. Order increments per supplier

Round each line up to the supplier's standard increment. Order in the smaller increment only when usage planning for the next 60 days is well under the larger one and there is no recurring shortage history.

SUPPLIER	STANDARD INCREMENT	NOTES
Flavour Art	1 kg (1000 g)	Buy in 1 kg only.
TFA	Gallon (3785 mL)	16 oz = 473 mL, 32 oz = 946 mL when usage is genuinely small.
Capella	16 oz (473 mL)	Most flavours; gallon for skipper-tier usage (e.g. Pralines & Cream).
Flavora (via DIY)	250 mL or 500 mL	Default to 500 mL to stay safe; 250 mL only when usage planning is well under.
Lorann	16 oz (473 mL)	Buy via DIY when volumes are small; direct from Lorann when consolidating.
Innawera	Small jar	Bought via DIY — single source for low-volume flavourings.
Mullenberry	Buy via DIY	Direct shipping is uneconomic; pay the DIY markup, save on freight.
Bryson Flavorah	Direct	Email order; volumes vary by recipe.
Riot Squad (Bulk US)	60 or 90 day plan	Plan 90 days because lead time is ~30 days; never run a 60-day plan.
Dvine Laboratories	Direct	Used for the Great Lakes raspberry SKU.
Sweetener / Pralines & Cream	Round up	These two run out almost every month — always round up to the larger increment.

12. Use Usage Planning to break ties

When the calculated need lands between two increments, use the Usage Planning column (next-month projected use) as the tie-breaker:

- If usage planning for the next month is at or above the smaller increment, round up to the larger.
- If usage planning is well below the smaller increment (under ~50%), the smaller increment is fine.
- For Riot Squad and other long-lead Bulk US suppliers, always round up — a 30-day re-order window is too narrow to recover from a shortfall.
- Pralines & Cream, Sweet Strawberry, Super Sweet, RY4 Double, Sweetener, Menthol, and Mentha (Capella V2) consistently consume a full gallon per cycle — default to gallon regardless of marginal need.

13. Account for the ML-adjusted weight discrepancy

When new flavouring is logged in Erply by gross weight, the ML-adjusted value (final amount after subtracting the empty-container weight) systematically reads ~5% lower than the supplier-stated volume. A 5000 g receipt typically books as 4750 mL on hand. Build this into supply planning against monthly ML need — do not assume gross receipts equal usable mL.

If a row's ML-adjusted value reads negative (e.g. -1143 mL), the tare weight on that container is wrong. Flag it to Operations for correction before relying on the row in any plan.

14. Print and distribute the order list

Print three copies of the Flavour Ordering Plan pivot, 8.5 × 11, double-sided:

- Buyer copy — marked up as orders are confirmed.
- Receiving copy — handed to Jose so receipts can be checked off as items arrive.
- Operations Manager copy — cross-reference for production blockers and partial deliveries.

15. Send orders to suppliers

All suppliers except TFA receive their order by email. TFA orders are placed through the supplier portal at <https://shop.perfumersapprentice.com/> using the credentials below.

SUPPLIER	CHANNEL	ADDRESS / LOGIN
Flavour Art	Email — Orders Flavour Art	orders.fana@flavourart.it
Capella	Email — Hugo Goncalves	hugo@capellaflavors.com
Capella (alt)	Email — Tanya Whitfield	tanya@capellaflavors.com
DIY E-Juice	Email — Support	support@diy-ejuice.com
Bryson Flavorah	Email — Bryson	bryson@flavorah.com
Lorann (direct)	Email — Shelby Hibbard	ShelbyH@lorannoils.com

Dvine Laboratories	Email — Sales	sales@dvinelabs.com
TFA	Web portal login	https://shop.perfumersapprentice.com/
Bulk US — Riot	Email — Matthew Crann	mattc@bemoreriot.com
Bulk US — PGVG	Email — Adrien Malak	accounting@pgvgdistribution.com

TFA portal credentials are stored in the shared Operations password vault. If the password rotates, update the vault entry and notify the buyer; do not re-issue this SOP for credential changes.

Non-Compliance

Skipping the unfinished-goods pull, mismatching the inventory date between the warehouse and unfinished pulls, or failing to clear column K before the new month produces a corrupted plan that either over-orders (working capital tied up in flavouring) or under-orders (production blocks). Stockouts on Loose Cannon, Skipper or Dark 30 attributable to a missed monthly cycle are tracked as a process failure and reviewed by the Operations Manager.

Exceptions

Extending coverage beyond the 60-day default — 90 days for slow suppliers such as Riot Squad is standing practice and does not require approval. Extending to 120 days or more, or switching a supplier from DIY to direct mid-cycle to consolidate freight, requires approval from the Operations Manager before the order is placed. Mid-month emergency top-ups are placed per-incident when a production block is imminent and are recorded on the next month's plan as an out-of-cycle line.
