

Update sales dashboards (DSS / FLVRS / ACT).

STANDARD OPERATING PROCEDURE — SALES

Document ID	SOP-SALES-003
Document type	Standard Operating Procedure
Department	Sales
Owner	Sales Reporting Analyst
Version	v1.0
Effective	June 2026
Status	Active

1. Purpose

This procedure ensures every DSS sales reporting surface — DSS Sales, FLVRS Sales, ACT Dashboard, Missing Opportunities, Back In Stock, and the Power BI dashboard — is refreshed from the same source extract on a consistent cadence. Running the steps in order keeps the numbers across dashboards reconciled and the published Power BI report in sync with the underlying Excel automations.

2. Scope

This SOP applies to any DSS employee responsible for maintaining sales reporting, business intelligence, or Power BI dashboards. Out of scope: designing new dashboard visuals, modifying the underlying Power BI semantic model, and creating new automation macros — those changes go through the BI lead before any refresh run.

3. Required files and systems

Confirm access to every path below before starting. A broken path halts the chain — none of the later macros run cleanly if a file cannot be opened.

FILE / SYSTEM	PATH	USED IN
Sales extraction folder	P:\- DSS Tools\3. Sales & Reporting\3.1 Sales Report Automation	Step 1
Sales report workbook	P:_Pamela\!Sales, Samples & Reports\1 - Sales Report Automation\Sales Report.xlsm	Steps 2 to 8
Power BI dashboard	P:\- Power Bi\2 - Dashboard\Dashboard 2025.pbix	Steps 11 to 12
Back in stock automation	P:\- DSS Tools\3. Sales & Reporting\3.9 Back to Stock\Back to Stock Automation.xlsm	Step 10
Missing opportunities	C:\Users\juan\OneDrive - Vapeur Express\Teams Reports\Missing Opportunities\Missing Opportunities.xlsm	Step 9
Power BI workspace	Power BI Service — workspace access required	Step 12

4. Procedure

Step 1 — Run sales data extraction

Navigate to the sales report automation folder and launch the extraction batch file.

Folder: P:\- DSS Tools\3. Sales & Reporting\3.1 Sales Report Automation

Run: Run_Sales_Reports_Data_Extraction.bat

Wait for the batch window to complete before continuing. The downstream macros assume the extract has finished.

Step 2 — Refresh the sales report workbook

Open the sales report workbook.

Open: P:_Pamela\!Sales, Samples & Reports\1 - Sales Report Automation\Sales Report.xlsm

Select Data → Refresh All. Let the queries complete before moving on.

Step 3 — Validate SKU updates

Inside the refreshed workbook, review the validation tabs:

- SKUs for Update — confirm new or changed SKUs are recognised.
- FLVRS Checker — confirm FLVRS line-item mapping is current.

If either tab flags unresolved items, correct the source list before running the dashboard macros.

Step 4 — Review supporting databases

If any of the supporting databases need to be updated this cycle, update them now. The dashboard macros pull from these files.

DATABASE	PATH
Taxes file	P:_Pamela\Sales, Samples & Reports\Sales Report Monday Template - April 28 2025 Update.xlsx
Cost file	P:\Sales Dashboard\Sales Reports\2021\Sales Margin - 28 June 2021_nov8.xlsx
Customer database	P:\- Power Bi\1 -Data Base\Customer Data Base\Customer Data Base DSS.xlsx
Product category file	P:\- Power Bi\1 -Data Base\Products\Product Category.csv

Step 5 — Clean the FLVRS weekly sales report

Open the FLVRS weekly sales sheet. Review the transaction list and remove any retail transactions — wholesale-only data should reach the dashboard.

Step 6 — Update DSS dashboards

From the sales report workbook, run the DSS dashboard macros in order:

1. Run **DSS – Update Sales Dashboard**.
2. Run **DSS – Update Orders Dashboard**.

Wait for each macro to finish before launching the next.

Step 7 — Update FLVRS dashboards

From the same workbook, run the FLVRS macros in order:

1. Run **FLVRS – Update Sales Dashboard**.
2. Run **FLVRS – Update Orders Dashboard**.

Step 8 — Update ACT dashboard

Run the ACT dashboard macro:

1. Run **ACT – Update Data Dashboard**.

Step 9 — Review missing opportunities

Open the missing opportunities workbook.

Open: C:\Users\juan\OneDrive - Vapeur Express\Teams Reports\Missing Opportunities\Missing Opportunities.xlsm

Review for new entries. If new entries exist, run:

1. Run Feed_BackOrders.

Step 10 — Update back in stock tracking

Open the back in stock automation workbook.

Open: P:\- DSS Tools\3. Sales & Reporting\3.9 Back to Stock\Back to Stock Automation.xlsm

1. Refresh all data.

2. Run Append_BackInStock_Log.

Step 11 — Refresh the Power BI dashboard

Open the Power BI dashboard file.

Open: P:\- Power Bi\2 - Dashboard\Dashboard 2025.pbix

Select Home → Refresh. Wait for every query to finish — partial refreshes publish broken reports.

Step 12 — Publish the Power BI dashboard

From the Home ribbon, select Publish.

Figure 1 — Power BI Desktop Home ribbon with the Publish button highlighted.

Choose the correct workspace and confirm.

Figure 2 — Publish to Power BI dialog: select the destination workspace and click Select.

Overwrite the existing report when prompted.

Figure 3 — Replace this dataset prompt: click Replace to overwrite the existing Dashboard 2025 semantic model.

Confirm the success message before closing.

Figure 4 — Publishing to Power BI success message. Dismiss with Got it.

5. Completion checklist

Tick each item before closing the cycle. If any item is unchecked, the dashboards are not in sync.

- ☐ Sales extraction completed.
- ☐ Sales report refreshed.
- ☐ SKU validation completed.
- ☐ Supporting databases reviewed and updated where required.
- ☐ FLVRS weekly sales report cleaned of retail transactions.
- ☐ DSS dashboards updated (Sales and Orders).
- ☐ FLVRS dashboards updated (Sales and Orders).
- ☐ ACT dashboard updated.
- ☐ Missing opportunities reviewed; Feed_BackOrders run if needed.
- ☐ Back in stock log updated.
- ☐ Power BI dashboard refreshed.
- ☐ Power BI dashboard published and overwrite confirmed.

Non-Compliance

Skipping or reordering steps breaks reconciliation between dashboards. The most common failures and their consequences:

- **Publishing the Power BI report without refreshing first** — stakeholders see stale figures and trust in the dashboard erodes.
- **Forgetting to remove FLVRS retail transactions** — wholesale margin and customer counts are overstated for the week.
- **Running dashboard macros before SKU validation** — new or renamed SKUs land in the wrong category and roll up into the wrong totals.
- **Choosing the wrong workspace at publish** — the published report does not reach the audience and the previous version remains live.

Any of the above requires a full re-run of the affected steps and a Teams note to the Sales Reporting Analyst within the same business day.

Exceptions

Skipping any step requires written approval from the BI lead before the run. Acceptable grounds for deviation: a source file is locked or unavailable, a macro has a known bug under active fix, or a partial publish is requested for a single audience. Record every exception in the Sales Reporting log with date, reason, approver, and the step that was skipped or modified.
